Research interest

Plasma Physics and Magnetic Confinement Fusion (Reversed Field Pinches and Tokamaks) both experimentally and via numerical modelling, with emphasis on:

- (a) Electromagnetic turbulence induced transport in the external region of magnetically confined plasmas
- (b) Statistical properties of plasma turbulence, investigated through advanced tools as Wavelet Transforms, Local Intermittency Measurements, Waiting Time distribution
- (c) Coherent structure generation as results of non-linear evolution of plasma instabilities
- (d) Non linear interaction between turbulence and sheared flows
- (e) Sheared flow generation mechanism through non-diagonal part of stress tensor
- (f) Numerical modeling of electromagnetic plasma turbulence using fluid approach

- (g) Filamentation of coherent structure with emphasis on *blobs* observed in laboratory plasmas and *Edge Localized Modes*

The principal results obtained by Dr. Vianello may be summarized as follow:

- First experimental proof of non applicability of *Self Organized Criticality* paradigm to edge plasma turbulence [8, 3]
- First experimental evidence of non-linear generation of edge flow in Reversed Field Pinches through Reynolds stress mechanism [29, 28]
- First experimental measurements of parallel current associated to coherent structures in a laboratory plasma [53]
- First experimental evidence of the existence of a particular class of coherent structure, named *Drift-Kinetic Alfvén vortices*, arising because of the non linear coupling of Drift and Kinetic Alfvén waves in a laboratory plasma [62]. This type of structure has been previously detected in the magnetosphere
- First experimental estimate of parallel current associated to Edge Localized Modes filament [70]
